

This valve is designed to allow the user to choose between two different circuits. With the configuration shown above, one double acting valve may be used to control two different double acting cylinders. Ports C1 and C4 are used to control circuit 1, and ports C2 and C3 are used to control circuit 2. The switch is used to select which circuit is selected. In the de-energized state, circuit 1 is selected. When the solenoid is energized, circuit 2 is selected.
