

# John Deere X-Series Replacement Engine Installation

Thank You for purchasing our X-Series Fuel injected engine kit. You will find that there are some items that need to be transferred from your old engine to make this engine complete and ready to run in your tractor.

- The temperature switch needs swapped over from the old engine.
- The 6 prong plug is all set up for plug and play, but the fuel injection harness will need to be swapped over to the new engine.
- The original high pressure connector will attach to the copper nipple for the fuel line. The return fuel line will attach to the plastic tee coming off the engine just like the original.
- The PTO adapter bolted to the flywheel needs transferred to the new engine.
- The engine has NO oil so that will need to be added. 10W30 oil is recommended.

Thank you again for your purchase and if there are any questions please call.
